

Setting an Adobe ID in the Onleihe app is no longer supported for iOS since the app version 5.6

As already announced many times, the Onleihe plans to gradually reduce the support for the Adobe DRM.

For the very few titles whose usage is well below 1% and which still require an Adobe ID, there is the option of using external readers such as PocketBook for example.

In version 5.6 for iOS, we have therefore brought forward a planned development step with which there is no longer any possibility of storing the Adobe ID in the app.

In the case of titles encrypted with Adobe DRM, an error message is currently displayed. These titles can still be opened externally and with the 5.7 update, the download of such titles will automatically lead to the option "Open externally".

The same step will be implemented with the Android app in one of the next versions.
