

iOS 10.3.x on 32-bit devices is no longer supported

[Export in PDF](#)

Since the update, Apple devices with iOS 10.3.x that are still built with a pure 32-bit processor no longer have the option of accessing the current DRM of the eAudios and cannot use the Onleihe app with the update to version 5.6 any longer. The app crashes when opened.

The background is that 32-bit devices are no longer supported by many systems and software manufacturers. Since the Onleihe app was updated for iOS 14, this also applies to eAudio playback. Unfortunately, a technical check with our software partner showed that there is no way to bypass the missing hardware support.

The following devices are particularly affected:

- iPhone 5
- iPhone 5c
- iPad Mini 1st generation
- 4th generation iPad

Newer models, such as the iPhone 5s or the iPad Mini 2 and 3, already have the 64-bit system from Apple installed and are not affected by this.

A check has shown that it is unfortunately not possible to remove the old app version 5.6 from the app store, so that when the app is reinstalled on devices with iOS 10.3.x, the previous version 5.5.4 is loaded.
